Amendments To The Abstract

Marked up Version

The following marked-up version of the amended Abstract is attached hereto to aid the examiner in identifying the changes:

A method of repelling or deterring slugs using naturally occurring secretions of ground beetle and applying the secretions to a portion of a plant. The secretions of the beetles comprise at least one of methacrylic acid, tiglic acid, crotonic acid, formic acid and acetic acid. ~~In the UK slugs can be a major problem in vining peas. Their climbing and feeding habit on pea plants can often result in large numbers being picked up by the viners, causing contamination and possible rejection of the crop, consequently leaving the growers to meet the loss and face the costs. A likely answer, using the current interest in natural enemies as sources of potential chemical repellants, is not being studied by a PhD student at Cardiff University and hopefully this could lead to a new slug deterrent. It has been known for quite some time that slugs are reluctant to enter areas recently colonized by ground beetles, but it is only from an extensive series of laboratory experiments that it has become clear that slugs respond to chemical secretions from the beetles pygidial glands—situated at the tip of the abdomen (see description FIG. 1). Normally discharged from the glands in response to attack by beetle predators, these secretions contain a cocktail of noxious substances—usually a mixture of acids and alkanes although the balance may vary from species to species (see description, FIGS. 2-5) as a significant change in the behavior of the slugs when exposed to beetle extracts. Video recordings used to carry out these tests reveal a direct and rapid reaction on the part of the slugs when coming into contact with beetle extracts showing that the results are very encouraging (see description, page 1). The test also revealed that these slugs do not die during the course of this experiment. This must show that when slugs are exposed to beetle extracts there will be no side effects. The important chemicals have since been obtained, from commercial sources and tested to show its effect on deterring slugs from feeding on to growing plants and its~~
